

## CHAPTER 10 EXAM OUTLINE

**NUMBER OF QUESTIONS:** 11 QUESTIONS

**TOTAL NUMBER OF POINTS:** 100 POINTS

**TIME ALLOWED FOR EXAM:** 75 MINUTES

| SECTION | TOPIC (# OF PROBLEMS ON EXAM) |
|---------|-------------------------------|
|---------|-------------------------------|

|           |                                                                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 10.1A     | Determine if a sequence converges or diverges. (2 questions)                                                                                     |
| 10.2      | Which series converges or diverges. If it converges find its sum (2 questions)<br>Telescoping Series (1 question)                                |
| 10.3      | Integral Test (1 question)                                                                                                                       |
| 10.5      | Ratio Test (1 question)                                                                                                                          |
| 10.6      | Which series converge absolutely, which converge conditionally, and which diverge? (2 questions)                                                 |
| 10.7      | Find the series' radius and interval of convergence. For what values of $x$ does the series converge absolutely and conditionally? (1 questions) |
| 10.8/10.9 | Find the Taylor/Maclaurin Series for the function. (1 question)                                                                                  |
